Operationally-Oriented Management Systems

Financial Systems Lack Operational Functionality

SMDS Supply provides the first, easy, supporting systems step. It enables you to manage your replenishment function in the most cost-efficient way while maximising customer service.

Optimising the employment of your working capital is a further step along the road. This step however, needs to be supported by a suitable system in order to be sustainable into the long-term as process-change in this area will be manually intensive and is unlikely to last into the long-term.

Almost certainly at this stage, you are still unable to effectively manage inventory in all points it is held. Your purchasing function is probably still reliant on largely manual, process-heavy systems

and the reports you receive are not about operational events, they are about financial events.

This is fine if you work in parts of the organisation responsible for conducting financial analysis and activities.

If, on the other hand, you are one of the many line managers responsible for delivering cost-effective service 100% of the time—on time and on budget—these financially oriented systems don't necessarily help you achieve your goals.

Best-of-breed Inventory Management and Purchasing systems are essential in this context.

SMDS's Inventory and Purchase Modules offer you the capability of managing inventory at every

stocking point in your organisation—as well as fully automating the buying function while integrating seamlessly with whatever financial system you operate.

When you realise that between 90% and 95% of working capital in your environment is held outside your warehousing locations, and the waste that occurs in other storage locations due to inadequate inventory management systems, implementation of SMDS Inventory and Purchase becomes the logical next step.

SMDS's Inventory and Purchase Modules provide functionality beyond that found in financial management systems and enable management of these essential operational activities at the source.

Functional Snapshot—SMDS Inventory

SMDS Inventory offers comprehensive options for controlling inventory across the entire organisation.

The module makes it possible to track data of deliveries and purchases on a daily basis, with a suitable explanation of data in i.e. matrix tables. The module can be fully integrated with other modules thus providing comprehensive

options for controlling inventory and minimizing stock - all without compromising customer service.

Functionality includes:

- Inventory balance
- Inventory value list;
- Inventory control on as many locations as you wish - to ward, department level if required;
- Transfer of inventory

stock between departments;

- Inventory adjustments and -counting of stock items;
- Calculation of stock value in the units in each department;
- Production of treatment sets (bill of materials);
- Documentation of item transactions.

**Space Saving Storage
Cost Saving Solutions**

Healthspace Pty Ltd are specialists in configuring space saving storage solutions for all manner of health service provider environments. We are the only such specialists working in Australasia.

Our modular storage system is sourced from Scan Modul in Denmark, the home of brilliant space-saving and modular design.

Our SMDS "No-Count" material management software provides the most cost-effective and simple solution to replenishing all point-of-use locations in your facility with ease and a minimum of work.

hTrak compliments the general data collection capability by enabling traceability of items to patient for safety and/or billing purposes as well as facilitating immediate replenishment by your suppliers.

We have the capability of providing every part of your solution—from a single trolley to project managing full storage solution implementations

Functional Snapshot—SMDS Purchase+

SMDS Purchase consists of in-depth information on vendors and features that enable total control of purchasing in a hectic hospital environment.

Integrating with the inventory module and defining the maximum and minimum values of the stock, as well as reorder quantities, resulting in an effective reordering procedure. The module optimises customer support and liquidity by having the right items at inventory at the right time.

- Vendor card index
- Purchase orders
- Purchase credit note
- Direct delivery

- Email of purchase order and -enquiry
- Electronic item receipt
- Automatic reordering of stock items
- Purchase authorisation control
- On-line ordering for departments
- Invoice and quantity discount
- Control of contract prices

Beyond the implementation of the Purchase Module Healthspace can apply the solution so successful in our Goulburn Valley Health project—automating the Purchase process through e-Commerce using Pacific Commerce. This ensures purchasing

occurs automatically when the scan data shows an item has reached its reorder point.

Given that 95% of purchasing and replenishment is repetitive this addition eases the administrative burden considerably—although it needs to be done in tandem with our next step, process optimisation.
